

Event Finder Extensions - Eetu Eskelinen

I decided to remove the button that would fetch the event data on a click event. I felt that it was more intuitive if the data loaded automatically as the site loaded, especially since we're only displaying five events.

As for the map, I decided to add a geolocator. The site will prompt the user to share their location, and it will be shown on the map with an info window. If the user shares their location and then clicks on a marker, a car route from the users current position to the selected event will be drawn.

I built the to look ideal on a Full HD monitor. It may look different, if viewed on a different resolution. Here's what it's supposed to look like, anyway!
